

Acknowledging A Seborrheic Keratosis And Why It Matters: Dr Hendi & Partners: Skin Cancer Cells Experts A skin doctor can establish whether wart-like developments are seborrheic keratosis (benign) or actinic keratosis (precancerous) based on their look. But in situations where the growth appears like skin cancer cells, the skin doctor may execute an additional biopsy to create a clear-cut medical diagnosis. A skin doctor can diagnose a seborrheic keratosis through examination. A couple of seborrheic keratoses that develop progressively in time is typical and generally not a cause for concern, especially for individuals older than 50. Seborrheic keratoses are common benign (noncancerous) skin growths that can occur anywhere on the body. While it is feasible to have a seborrheic keratosis, it is more typical to establish many of these growths, particularly with enhanced age. Seborrheic keratosis is generally safe, and there aren't lots of treatments beyond removing it. Some people select to have them eliminated if the developments come to be unattractive or itchy, or come to be irritated from rubbing against garments. Elimination approaches include cryotherapy, cut biopsy, laser surgical treatment, curettage, and cautery.

Locate Your Treatment
