As the ball falls, it bounces randomly left and right until it lands in one of the slot multipliers at the bottom of the board.

When a player starts a drop, several variables should be set:

1. **Bet Amount:** The wager put on a single drop.
2. **Danger Level:** Most platforms allow gamers to change the volatility (Low, Medium, High).
3. **Row Count:** Players can often select the size of the pyramid, typically varying from 8 to 16 rows. More rows suggest a larger spread and greater potential maximum multipliers, however likewise a lower likelihood of hitting those extreme edges.

The Physics of the Drop

As the ball hits each peg, it has an approximately 50/50 opportunity of bouncing to the left or right. Over countless drops, this develops a timeless bell curve (binomial circulation). The center slots-- which yield low returns and even losses on the bet-- are hit most frequently. Alternatively, the outer edges, which offer enormous multipliers, are struck hardly ever.
