

What eventing horses need horse feed

Eventing horses depend on **horse feed** that fuels training, competition, recovery, and day-to-day health. The best ration is not simply the one with the highest calories; it is the one that matches the horse's **energy** needs while keeping the digestive system steady, the temperament manageable, and the body in good **condition**.

For most **eventing horses**, the foundation should be a **forage-based diet**. Good quality **forage** delivers **digestible fibre**, which is the safest long-term fuel source for horses in regular work. Fibre helps with **gut health**, encourages chewing, and helps maintain a calmer, more reliable supply of **slow-release energy**. That matters for a **performance horse** that must stay focused across dressage, cross-country, and show jumping.

Event horses also need enough **protein** for **muscle development**, enough **calories** to avoid losing weight, and the right balance of **vitamins and minerals** to support recovery, hoof quality, and immune function. If the horse sweats heavily, **electrolytes** and good **hydration** become especially important. In practice, the best **horse feed** for eventing tends to be one that builds **stamina** without creating excess fizz.

A useful way to think about feeding event horses is this: feed the horse for **performance nutrition**, not just appetite. A horse that looks well fed but lacks top-line, loses weight in work, or becomes sharp and difficult may need a different balance of roughage, energy sources, and supplementation.

Types of horse feed and how each works

There are various **types of horse feed**, and each works differently. The main decision is usually between forage, **hard feed**, and mixed feeds such as chop, cubes, nuts, and blends. The right combination depends on the horse's activity level, body type, and response to feed.

Hard feed is a wide term that includes cereals, compound feeds, cubes, and mixes. It is often used to provide extra calories, protein, and vitamins when forage alone is not enough. Some hard feeds are designed for gradual, consistent conditioning, while others provide a quicker energy boost.

Chaff is chopped forage, often with added oil or molasses. It is useful because it increases chewing time and can slow the rate of eating. Chaff can also improve **palatability** and help carry supplements through the bucket. For many eventing horses, chaff is an important part of feeding management because it supports roughage intake while making the ration more practical.

Oats remain a traditional energy source, and some horses thrive on them. They can provide a useful energy lift, but they are not ideal for every horse because they may be higher in **starch** and can produce a hotter response in sensitive animals. For that reason, oats suit some horses in intense work but are not automatically the best choice for every event horse.

Other ingredients frequently used in event horse diets include beet pulp, oil, and fibre-based cubes or pellets. These can improve digestibility and provide energy in a more controlled way than high-cereal rations. The ideal mix depends on the individual horse rather than on trends alone.

Is fully balanced horse feed a good fit for eventing?

Fully balanced horse feed can be an effective choice for some eventing horses, especially if you want a simpler feeding system. A true complete feed is designed to provide a **complete diet** in one feed, often blending fibre,

energy, protein, **minerals and vitamins**, and sometimes oil. For horses that are picky eaters or difficult to keep in condition, that can be highly useful.

The main advantage is ease and consistency. If the feed is formulated well, it can reduce guesswork and help maintain a suitable **body condition score**. That can be especially useful when you are juggling training, travel, and competition schedules. A complete feed can also support horses that need a controlled starch level, since many modern versions focus on fibre and oil rather than cereal-heavy formulations.

However, complete feed is not automatically the right solution for every horse. Some eventing horses do better on a forage-first plan with a **ration balancer** or separate supplement, especially if they already get enough calories from hay or haylage. If a horse holds weight well, a more basic ration may be enough. If a horse needs more calories, muscle support, or better cover, a complete feed may be a stronger match.

The key is to review the label and the **nutrition profile**. Compare digestibility, protein level, oil content, fibre source, starch, and sugar. A feed that looks like a complete ration on paper still needs to suit the horse's temperament, workload, and current condition. In other words, the best complete feed is the one that genuinely fits the horse rather than the one with the loudest marketing.

How to choose horse feed for beginners

If you're looking for **horse feed for beginners**, begin with the basics: check the horse's current **bodyweight**, condition score, work level, and access to **forage**. First-time feeders often focus too much on energy feeds and not enough on whether the horse is already getting enough roughage. A good feeding plan should always first begin with forage quality and quantity.

Develop a simple **feeding routine** and keep it as consistent as possible. Horses do best when their meals are given at roughly the same times each day. Consistency supports gut function, reduces stress, and makes it more manageable to notice changes in appetite or droppings that could signal a problem.

For a horse in light work, forage may do most of the job. For an event horse in regular training, you may need to add a fibre-based conditioning feed, a balancer, or a performance mix. The best approach is to raise calories gradually and observe the horse's coat, behaviour, and top line over time.

If you are uncertain where to begin, think in this order:

- Inspect forage quality and intake first.
- Track body condition and weight regularly.
- Tailor feed to **workload**, not just breed or size.
- Add energy from digestible fibre and oil before relying heavily on starch.
- Reassess the ration whenever training intensity changes.

This approach makes horse feeding much easier for beginners and helps avoid overfeeding, underfeeding, or sudden changes that upset the digestive system.

Equine feeding guidelines every event rider should follow

Solid **horse feeding rules** make eventing management practices safer and more successful. Many riders use an adapted version of the **10 rules of feeding horses**, even if they do not call them that. The specifics may vary, but the core principles are consistent: safeguard the gut, avoid big feed swings, and keep forage central.

First, provide ample roughage and avoid long gaps without forage. Next, feed **small meals** rather than large buckets that overload the stomach. In addition, keep **fresh water** available at all times, especially around travel, training, and competition. Fourth, make any diet changes gradually over several days or longer.

Other important horse feeding rules include:

- Feed for the horse's current **workload** and body condition, not for an idealised plan.
- Avoid relying on one ingredient to fix every issue.
- Make cereal-based meals sensible if the horse is sharp or prone to digestive upset.
- Promote recovery with forage, hydration, and electrolytes after hard efforts.
- Monitor manure, appetite, attitude, and body shape for early warning signs.

These guidelines matter because event horses often face fluctuating training intensity. A calm dressage schooling week may require a different feeding approach than a demanding cross-country phase. Feed management should follow the horse's workload, not just a fixed routine set months ago.

How to read a horse feeding chart

A **horse feeding chart** helps convert feeding decisions into a practical plan. It is no replacement for professional advice, but it is a valuable reference for matching the ration to the horse's **body condition score**, **workload**, and **forage intake**.

Begin by judging whether the horse is underweight, ideal, or overweight. Then review how much work the horse is doing each week and how intense that work is. A horse doing light flatwork needs a very different intake from a horse training with repeated schooling, galloping, and jumping.

<https://bifid.com/uk/>

When using a chart, check:

- The amount of forage is fed each day.
- Whether the ration delivers enough calories for the current workload.
- Whether the horse needs more protein for muscle development.
- Whether the horse is getting enough vitamins and minerals.
- Whether the feed supports a calm, manageable temperament.

A chart is most effective when it ties feed choices to outcomes. If the horse is dropping condition, the chart should suggest increasing calorie density or forage intake. If the horse is too sharp, you may need to lower starch and increase digestible fibre or oil.

How much horse feed does an eventing horse need?

The portion of **horse feed** an eventing horse needs varies with body size, temperament, forage access, and **workload**. At this point a **horse feed calculator uk** can be useful, but it should just be an initial guide. These tools can estimate daily intake, yet they cannot fully evaluate how the horse looks, feels, and performs.

A solid estimate begins with **bodyweight** and forage intake. Then you include concentrated feed only if the horse needs extra calories, protein, or micronutrients than forage alone can provide. Certain horses in moderate work maintain well on forage plus a balancer. Others need a full performance ration, especially if they struggle to hold condition or are doing more demanding work.

If you use a **horse feeding chart** alongside a calculator, you can check expected intake with actual results. Is the horse losing weight? Is the coat dull? Is recovery slow? Is energy inconsistent? These are more meaningful than simply feeding a fixed number of scoops.

For eventing horses, the goal is usually to keep the horse fit, fuelled, and mentally settled. That often means enough roughage, controlled energy, and regular adjustment based on training. A horse that is too lean may lack strength and stamina; a horse that is overfed may become uncomfortable or difficult to ride. Balance matters more than bulk.

How much does horse feed cost?

Horse feed cost depends on the make, feed type, sack size, and how many kilos the horse eats per day. A lower **bag price** doesn't necessarily mean lower overall cost, because a more concentrated feed may be fed at a lower rate. That is why it is better to compare **daily feeding cost** rather than the bag price alone.

To compare value, weigh how much of the feed the horse actually needs each day. If one feed is inexpensive but requires a large feeding rate, it may be more expensive in the end than a higher-priced feed that is more nutrient-dense. This is especially relevant when comparing **horse feed companies**, because different brands may use different formulations, ingredient quality, and recommended intakes.

Also factor in the cost of forage, balancers, supplements, and electrolytes. A ration that looks cheap may become expensive if it still needs multiple add-ons. A more complete formula may be better value if it meets the horse's needs in fewer products.

The most practical way to assess cost is to calculate monthly feeding cost based on the horse's actual ration. That gives you a practical comparison between feeds and helps you choose the most efficient option for the horse's workload and condition.

Should you choose branded feed like Spillers?

Spillers horse feed is one example of a branded option many riders consider for eventing. Branded feeds can be useful because they often come with clear feeding instructions, a stated **nutritional analysis**, and a range of products for different levels of work. For many riders, that makes feed management more straightforward.

Well-known **horse feed companies** typically offer specialised **performance feed** products, including low-starch, high-fibre, conditioning, and balancer options. That variety can help you tailor the ration to the horse's exact needs. The benefit is not the brand name itself; it is whether the product truly suits the horse's current condition and workload.

Prior to selecting any named feed, assess the formula and nutrition profile. Look for easily digested fibre sources, suitable oil content, reasonable starch and sugar levels, and a mineral profile that fits the rest of the diet. If a feed helps maintain stable energy, recovery, and muscle condition without making the horse sharp, it may be justifying the price.

Name-brand feeds can also make feed management easier for time-pressed riders because the instructions are easy to follow. That said, being simple should never replace observation. Keep checking the horse's body

condition, behaviour, and performance response.

Can you make a horse feed mix recipe?

A DIY **horse feed mix recipe** can be effective if you grasp the horse's dietary needs and keep the ration well-balanced. Many riders use a mix of forage, chopped straw, **beet pulp**, **pellets**, and **oils** to build a conditioning <http://business.woonsocketcall.com/woonsocketcall/markets/article/abnewswire-2026-7-24-with-half-of-britains-horses-overweight-bifid-launches-grain-free-low-sugar-feed-for-the-nations-good-doers/> diet that helps support steady-release energy and gut health.

Beet pulp is particularly valuable because it offers digestible fiber and can be a useful energy source without depending heavily on starch. Supplemental oil can raise calorie density and improve coat condition while maintaining the diet less heating. Feed pellets can add structure, protein, and vitamins, depending on the product chosen.

However, a home ration should still provide a balanced mix of **vitamins & minerals**. If you create a ration completely from ingredients without considering micronutrients, you may lead to deficiencies or excesses. Because of this, many owners combine a custom mix with a balancer or supplement made to finish the ration.

If you want to making your own mix, begin with a vet or nutritionist-approved plan. The purpose is not to invent a novel recipe; the purpose is to build a practical ration that suits the horse's workload, temperament, and digestion. A DIY approach can work well, but only when it is supervised closely.

Horse feeding advice: what to avoid in event horses

Helpful **horse feed advice uk** typically starts with the things to avoid. Event horses should not make rapid diet switches, high cereal intake, extended periods without forage, and feed plans that raise starch too high for the horse's temperament or digestive tolerance.

Starch and **sugar** are not inherently bad, but too much can create unhelpful excitability, erratic stamina, or intestinal upset. Horses that have issues with behaviour, tying-up risk, or gut sensitivity often do better on a reduced-starch, fibre-led ration with measured energy from oil and digestible fibre.

Another major risk is poor feed management around travel and competition. Changes in water intake, meal timing, and exercise routine can unsettle the gut and increase the risk of **colic**. Preserve routine where possible, offer water frequently, and avoid feeding large meals immediately before hard work.

Also avoid over-supplementing without checking the full ration. A horse can receive too much of one nutrient while still lacking another. The safest route is a well-balanced plan that considers forage, hard feed, work, and body condition together.

FAQs about horse feed for eventing horses

What horse feed is best for eventing horses?

The best **horse feed** for eventing horses is usually forage-led, with added digestible fibre, sensible calories, and balanced **vitamins and minerals**. Many horses do well on a high-fibre conditioning feed, a balancer, or a complete feed that supports gradual energy and a calm, athletic frame.

Should eventing horses be on complete horse feed?

Complete horse feed can be a good choice for some eventing horses, especially if you want a simple **balanced ration** with fewer extra products. It is not essential for every horse, though. If forage already covers much of the diet, a balancer plus targeted feeds may work equally well.

How much horse feed should an event horse get each day?

The right amount depends on **bodyweight**, **workload**, forage access, and body condition. Use a **horse feed calculator uk** and a **horse feeding chart** as guides, then adjust based on the horse's condition score, appetite, and performance. The horse should stay in good condition without becoming sharp or overweight.

How can I calculate horse feed cost per month?

To figure out **horse feed cost** monthly, multiply the amount fed each day by the bag cost per kilo, then use 30 as the monthly total. Also factor in the cost of hay, supplements, and any extras. Comparing daily feeding cost is often more useful than comparing **bag price** alone.

What are the the main horse feeding rules for performance horses?

The essential **horse feeding rules** are to provide plenty of hay, feed **small meals**, keep **fresh water** on hand, make diet changes slowly, and tailor feed to **workload**. Effective feeding management also means keeping an eye on body condition, maintaining gut health, and avoiding too much starch or sugar.
