Before buying, check a few things that actually matter:

- A fiberglass or steel slab with a stable core
- Weatherstripping that seals evenly all the way around
- An adjustable threshold for better contact
- A finish that can handle UV exposure
- Hardware that keeps the door aligned over time

Those details are not cosmetic. They determine whether the door will still close cleanly after a humid summer and whether you will be dealing with drag, drafts, or fading two years later.

A well-chosen entry door protects comfort, reduces maintenance, and door replacement holds up better to the weather that is part of daily life here.
